Sprint 1 Key Stories:
- As a user, I want to be able to login in from the home page.
  - Acceptance criteria: User is able to click on the 'login' button on the website and login with their Google account.

Sprint 2 Key Stories:
- As a user, I want to be able to create events viewable by others.
  - Acceptance Criteria: A logged in user is able to click on 'Create Event', add the date, time, location, and a description of the event and have it added to the database. Other users are then able to view this event on the 'Discover' page.

- As a user, I want to be able to view and join other events.
  - Acceptance Criteria: A logged in user can go to the 'Discover' page and join another user's event, successfully adding them to the events database.

Sprint 3 Key Stories:
- As a user, I want to be able to interact with joined and created events in my user dashboard.
  - Acceptance Criteria: A logged in user should be able to go to their dashboard and see a list of both created and joined events. They should then be able to leave events they've joined, or delete events they've created, thus modifying the database.

Sprint 4 Key Stories:
- As a user, I want to be able to view my events on a map.
  - Acceptance Criteria: A user should be able to see where events are being held, whether that be events they've created, joined, or are seeing in the discover page. They should be displayed on a map.

Known Problems:
- Filter button currently doesn't contain functionality.
- When editing a box, all fields must be edited / re-inputted
- When a user has the exact same name as another, it will incorrectly display the leave button as opposed to join.
- When someone tries to mass create, delete, or join / leave events, there is a synchronization issue between our backend and the database which causes the website to error out.

Product Backlog:

- As a user, I'd want to be able to use this outside of only Santa Cruz.
    - Eventually, the product can be expanded to be global as opposed to just in the University.
- As a user, I'd like to be able to create a group and notify people in the group when I'm hosting an event.
    - Groups can be created that allow for people to see where their fellow group members are going and decide to join those events too.
- As a user, I'd like to be able to get exact directions to an event and place events anywhere I'd like.
    - Proper map integration via Google Maps API can allow users to use google maps to find the best path to a certain events location, as well as allow users to pick their own event locations as opposed to a preset location.
- As a user, I would like to be able to rate other organizers, depending on their consistency and hospitality.
    - Rating system similar to Uber or Lyft where one can see the reputation of the organizer, if they are punctual, nice, etc.
- As a user, I would like to filter events by my interests.
    - Adding functionality to the filter button that will allow users to filter events by date, event type, location, etc.
- As a user, i would like to be able to send friend requests to like-minded individuals as well as view my friends list to see whos online
    - Adding a full friend request system where you can view friends, who's online, and what people are doing.
